RONNIE CLELAND

CREATIVE AI PLATFORM ARCHITECT

I build artist-facing AI tools that keep visual judgment in the creative loop.

01 ARTIST INTENT

02 CREATIVE CONTROL

03 ASSET CONTINUITY

04 PRODUCTION HANDOFF

22+ YEARS IN ANIMATION + VFX → REAL-TIME → CREATIVE AI PRODUCT

DESIGN · ORCHESTRATE · SHIP

ARTIST-FIRST · FULL-STACK PRODUCTION-READY

PORTFOLIO · 2026

From refining shots to designing how artists create them.

The throughline has stayed the same: visual judgment, iteration, and the reality of getting creative work across the finish line.

01

22+ YEARS

Animation + VFX

Composition, lighting, story, review, iteration, and studio pipeline reality.

02

NEXT

Real-Time

Interactive scenes and faster feedback deepen the relationship between creator, tool, and result.

03

NOW

Generative AI Product

Lumify: artist-controlled workflows across image, video, 3D, services, and handoff.

The craft did not disappear. It became product judgment.

Lumify is a creative environment, not a collection of AI demos.

A creator can start from an idea, image, project, or production asset and stay inside a coherent experience as the work evolves.

01 **Start from the work**

Idea, image, project, or source asset - not a blank prompt box.

02 **Keep work connected**

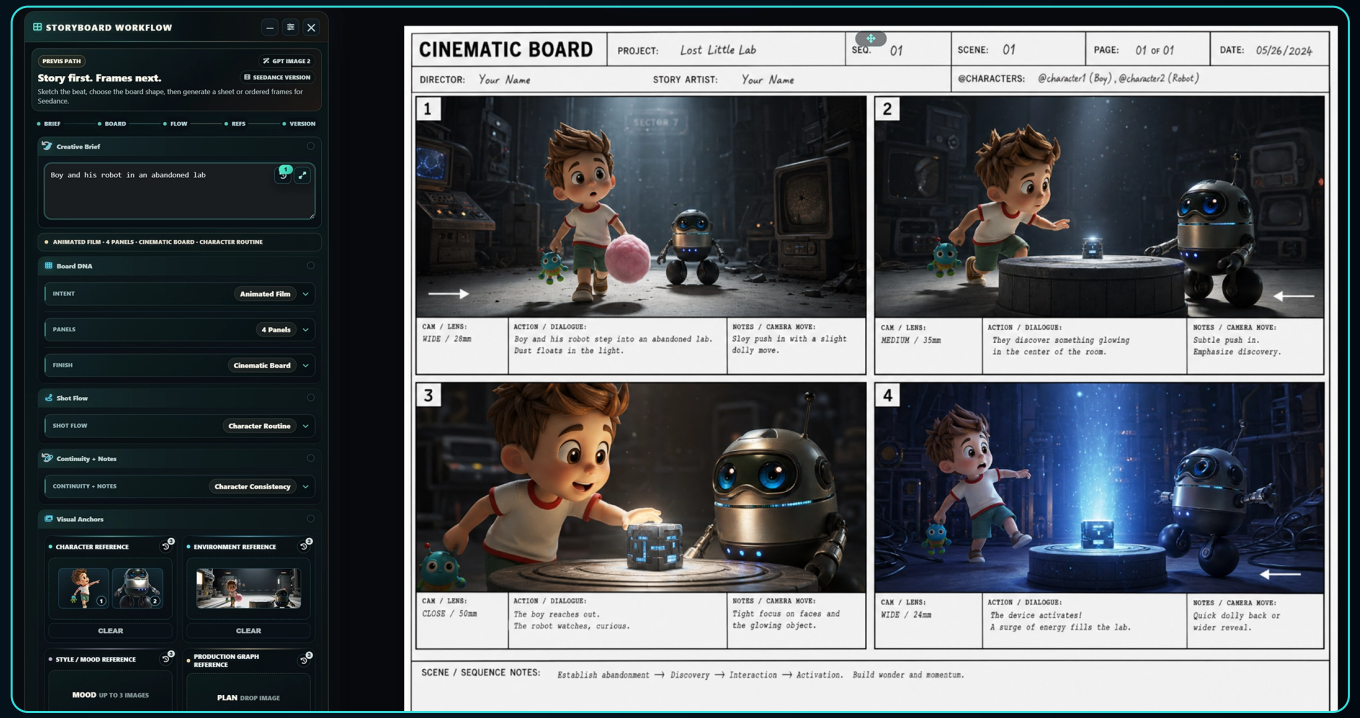

Canvas, assets, context, and iteration stay together.

03 **Control the creative loop**

Generation, refinement, review, and recent state share one surface.

04 **Evolve without breaking flow**

New models and workflows arrive without asking artists to relearn the product.

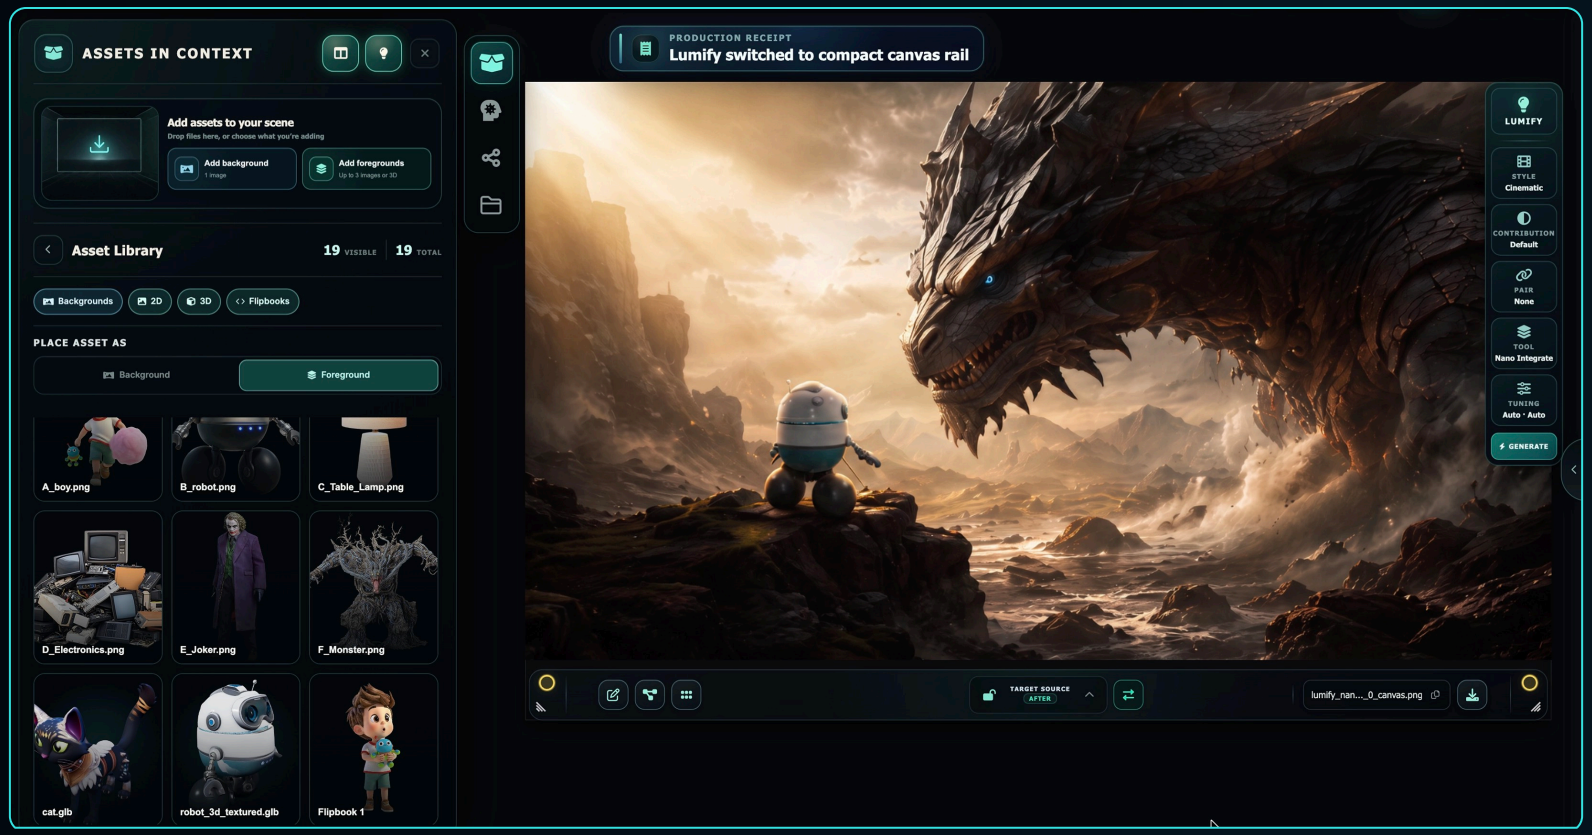

CO-FOUNDER & CCTO · LUMIFY

BROWSER-BASED · MULTIMODAL · ARTIST-FIRST

Creative direction should be visible, steerable, and recoverable.

The best AI interaction does not ask an artist to surrender judgment to a prompt. It makes intent visible, direct, and revisitable.

01 Named creative actions

A visual decision has a clear state, direct control, and meaningful result.

02 Session history

Current state and generation paths make iteration easy to understand.

03 Confidence controls

Tuning, seed, provider, and model-specific parameters stay visible when they matter.

04 Intent-preserving handoff

Assets, history, exports, and review keep the work usable after a generation completes.

The product is a workflow system— not a model menu.

Models can change. The artist's creative progression should remain legible, stable, and connected to the work.

01

CREATE

Start with context

- Canvas
- References
- Assets
- Starting idea

02

SHAPE

Direct the result

- Time of Day
- Materials
- Camera
- Layers

03

CONTROL

Work in view

- Model + provider
- Tuning
- Session state
- Visible feedback

04

REVIEW

Carry it forward

- History
- Asset Vault
- Packages
- Export

A durable interaction language lets the platform evolve without making the artist relearn the product.

I connect the experience to the system that makes it real.

My role is connective: turn visual intent into interface state, workflow logic, model selection, asynchronous execution, and a result someone can recover and use again.

01

ARTIST INTENT

Visual goal

References, constraints, visual target, and production context.

02

FRONT END

HUD + state

HTML, CSS, JavaScript, direct controls, validation, and visible feedback.

03

PRODUCT LOGIC

Policy + route

Capability-aware choices across provider, model, task, and deployment profile.

04

BACK END

Jobs + services

Python/Flask, REST, adapters, progress, cancellation, retries, and recovery.

05

PRODUCTION

Result + handoff

Metadata, history, comparison, Asset Vault, exports, packages, and audit-ready handoff.

ROLE

CONNECT THE LAYERS.

The differentiator is continuity: the artist's intention survives every layer.

2D, 3D, and real-time belong in the same creative loop.

World View extends the canvas into spatial exploration: bake or import a world, shape camera and composition, then return a snapshot to the image or video workflow for refinement.

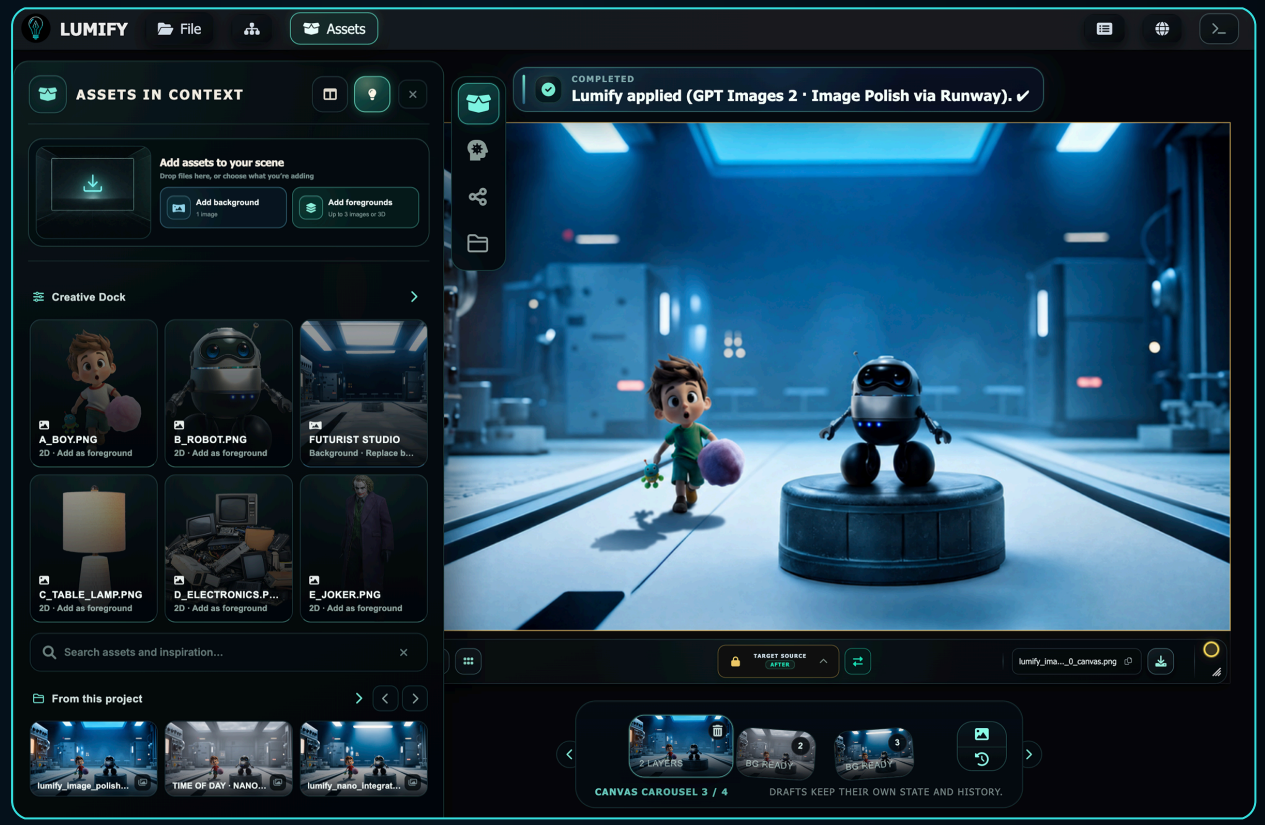

WORLD VIEW

Bake or import a world · shape camera · navigate composition · return to canvas

ASSETS + CONTINUITY

Source assets · foregrounds · recent passes · saved work · production handoff

HOSTED APIS + LOCAL MODELS

Production trust is designed into the experience.

Creative AI earns repeat use when artists can understand what happened, reproduce a result, interrupt work safely, compare options, and carry the work forward.

01	**Repeatability**	Seeds, parameters, references, model route, and metadata remain connected to the result.
02	**Visibility**	Provider, task, timing, progress, and confidence controls are surfaced when they matter.
03	**Recoverability**	Jobs expose cancel, errors, recent history, and comparison paths instead of trapping artists in a black box.
04	**Portability**	Assets, packages, export profiles, and shared production paths carry work into the next step.

This is the difference between an impressive demo and a tool artists can build a practice around.

Time of Day turns visual judgment into a named, direct action.

A compact creative choice can steer a lighting direction while protecting the shot artists have already built.

ARTIST GOAL

Choose a visual time and steer lighting without rebuilding the scene or surrendering composition.

INTERACTION

An in-canvas choice becomes a direct control, model route, visible state, and result history.

SYSTEM GUARDRAILS

Keep camera, composition, character, scene identity, and approved context steady while the desired change responds.

My product instinct: make the creative action simple, then make the system responsibilities explicit.

A working asset is more than a successful image.

It carries the choices that shaped it: source, state, history, metadata, and a path to the next stage of production.

01

SOURCE

Start with context

Images, foregrounds, references, and project material enter as part of the decision.

02

STATE

Keep choices legible

Model inputs, versions, recent passes, and workflow state remain visible and inspectable.

03

RESULT

Make output recoverable

Compare, promote, preserve metadata, and return to work without losing the decision trail.

04

HANDOFF

Carry it forward

Assets, packages, exports, 3D worlds, and video can move to the next production context.

The asset becomes the continuity layer between creative action and the work that follows.

The value is in the bridge between disciplines.

I can speak with artists, product leaders, designers, engineers, model providers, and partners without losing the creative objective.

CREATIVE JUDGMENT

22+ years in animation + VFX
Composition, lighting, story, review
Artist vocabulary and production trust

PRODUCT + UX

Workflow-first product thinking
Interaction systems and visual hierarchy
Feature definition and acceptance criteria

TECHNICAL EXECUTION

HTML/CSS/JavaScript
Python/Flask + REST services
Provider routing, jobs, assets, and policy

SHIPPED CREATIVE AI WORKFLOWS

Not a handoff between disciplines - a continuous line from creative intent to practical implementation.

Building artist-first creative systems where visual judgment and technology move together.

TARGET ROLES

- Creative AI Platform Architect
- AI Product Designer / Design Engineer
- Creative R&D Lead
- Generative AI Prototyping Lead
- Technical Art Director · Emerging Technology

WHAT I BRING

- Artist credibility
- Visual systems
- Multimodal AI fluency
- Product judgment
- Full-stack initiative
- Clear product storytelling
